

Геномная селекция в аквакультуре

Мюге Н.С., ВНИРО

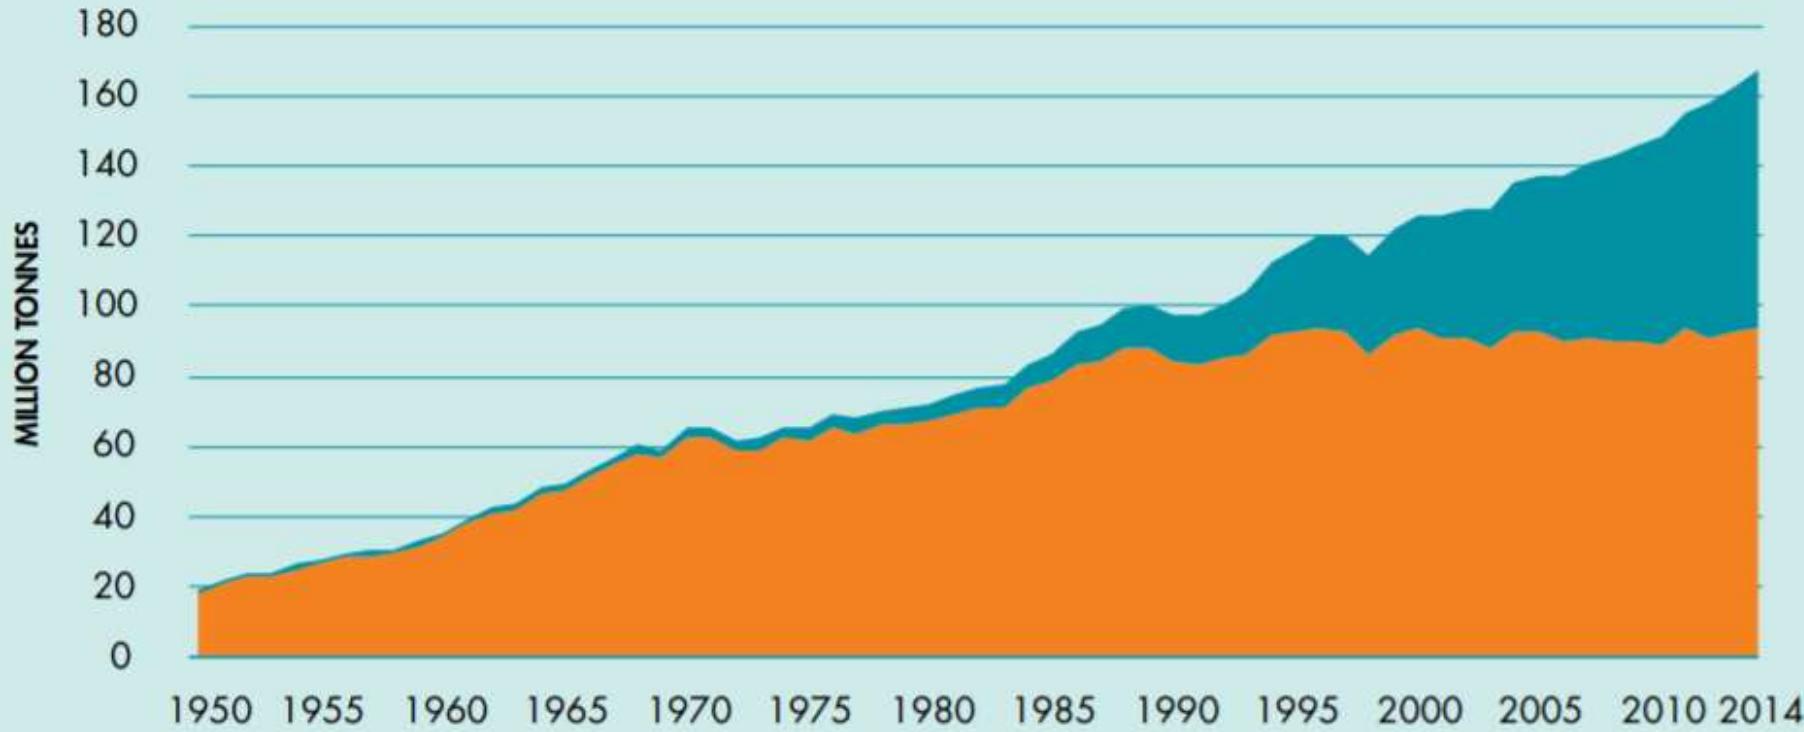

Аквакультура в мире:

- ▶ Продукция аквакультуры в мировом масштабе растет на 10% ежегодно.
- ▶ Общая продукция в мире >60 миллион тонн в год.
- ▶ Быстрое распространение и рост производства за последние 30 лет.
- ▶ 90% продукции аквакультуры – Китай и Юго-Восточная Азия.
- ▶ Подавляющее большинство используемых пород – результат “традиционного” одомашнивания.

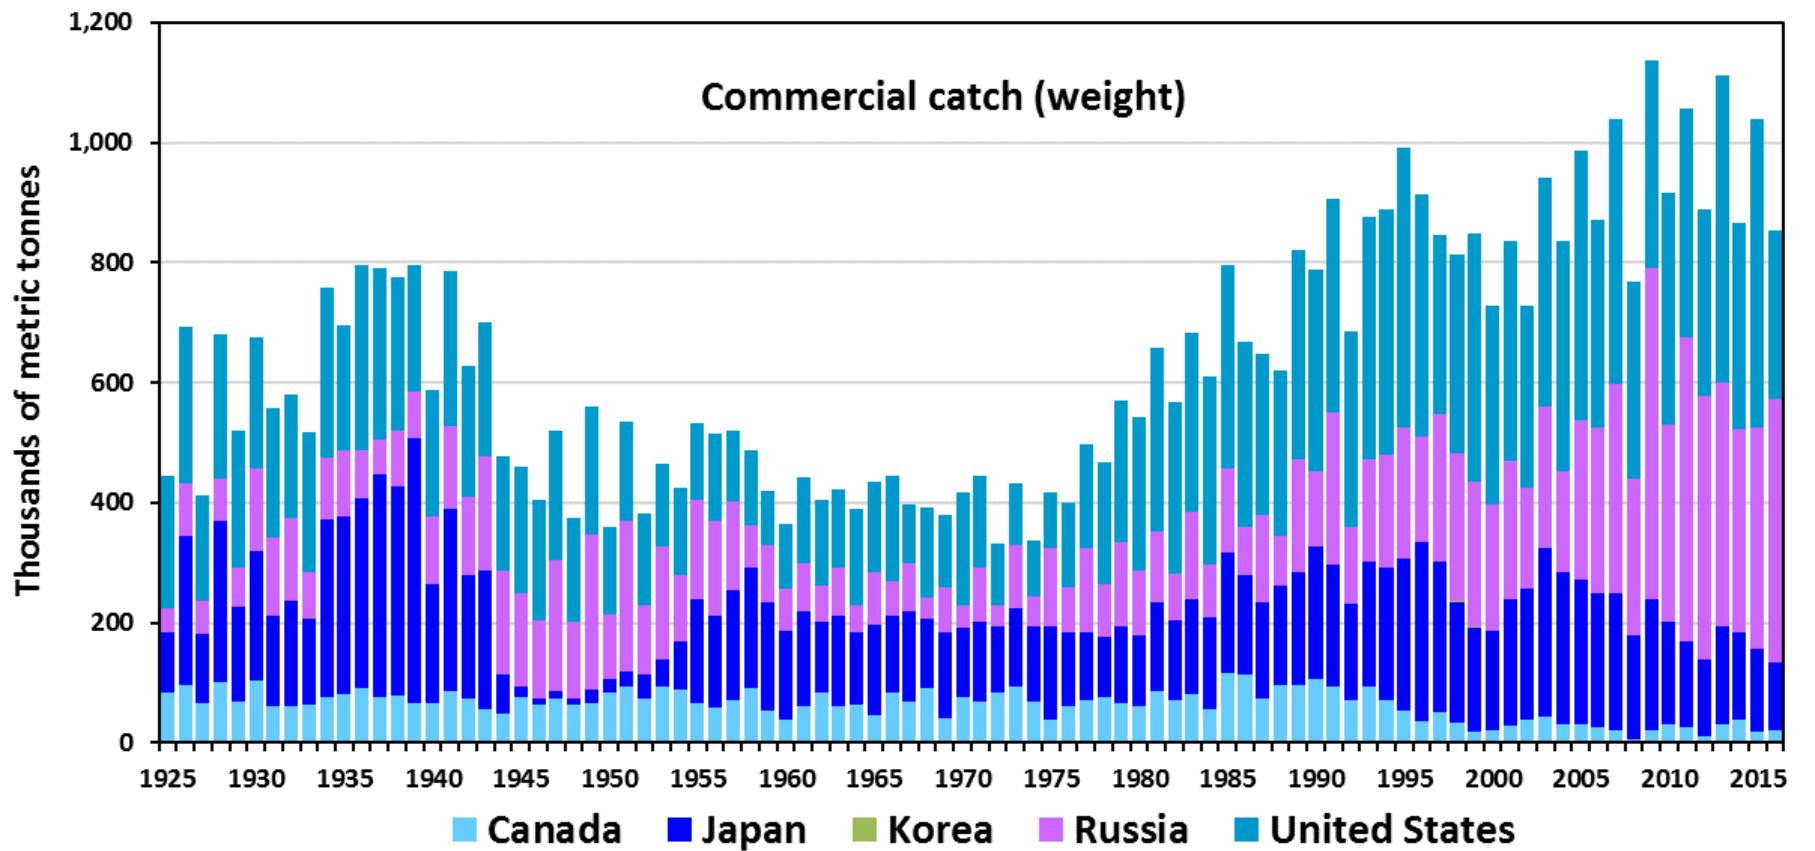

Данные ФАО (суммарно вылов и аквакультура, в мире)

Мировая продукция лосося в аквакультуре

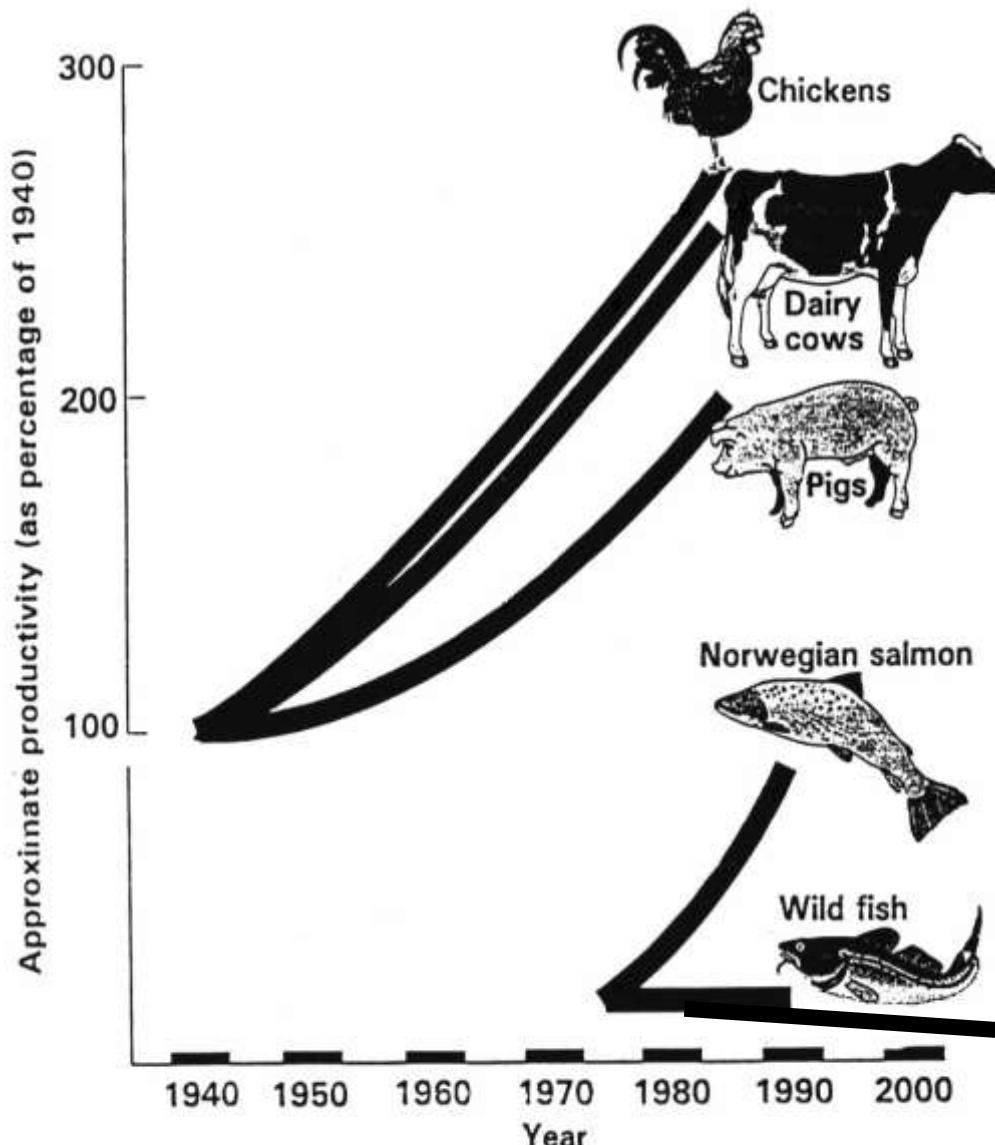

World farmed Atlantic salmon supply fell by 7% in 201

- ▶ Без применения генетических методов, качество пород, используемых в аквакультуре с времени понижается.
- ▶ ВСЕ другие отрасли (животноводство и птицеводство) используют генетически улучшенные породы (не путать с ГМО)
- ▶ Примеры применения современных генетических методов в аквакультуре пока редки

Динамика роста продуктивности

- ▶ Без применения генетических методов, качество пород, используемых в аквакультуре с времени понижается.
- ▶ ВСЕ другие отрасли (животноводство и птицеводство) используют генетически улучшенные породы (не путать с ГМО)
- ▶ Примеры применения современных генетических методов в аквакультуре пока редки

Development of productivity in farm animals and finfishes.

Роль генетики в аквакультуре

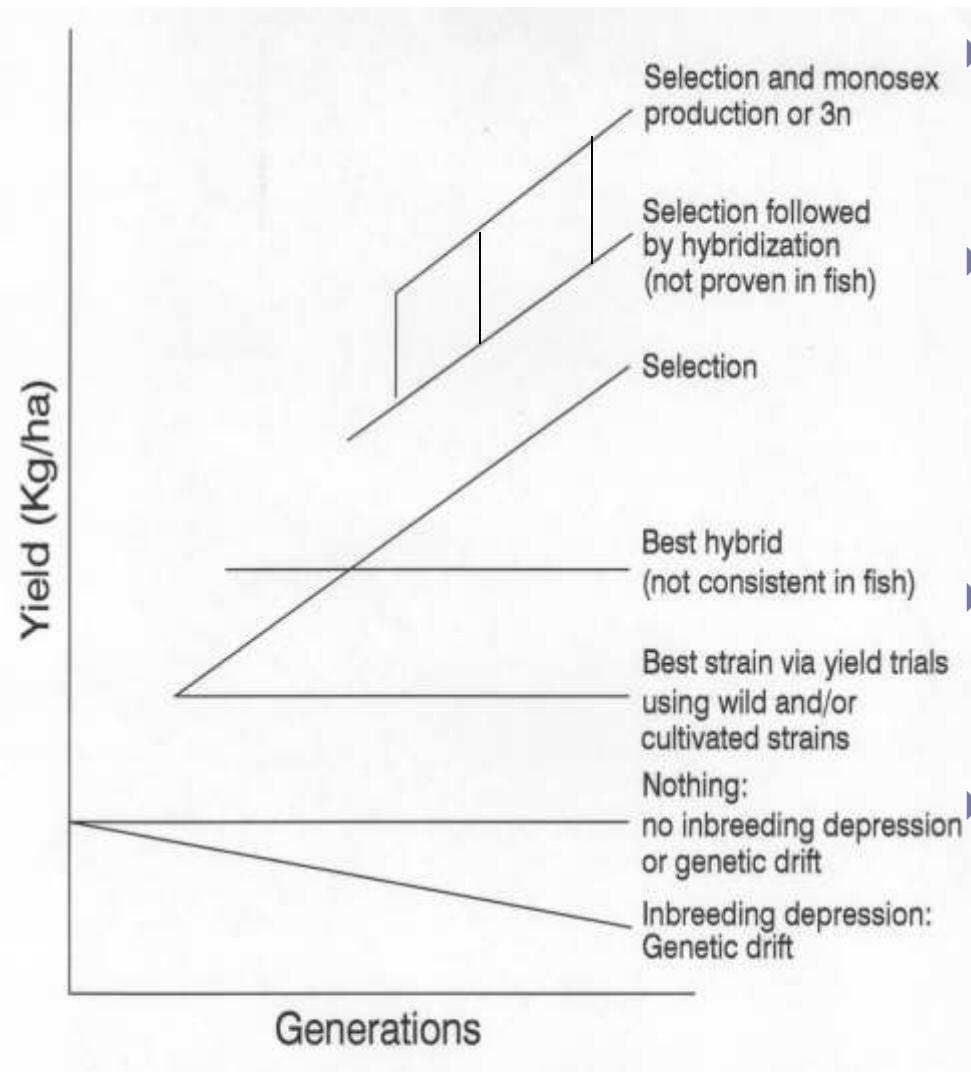

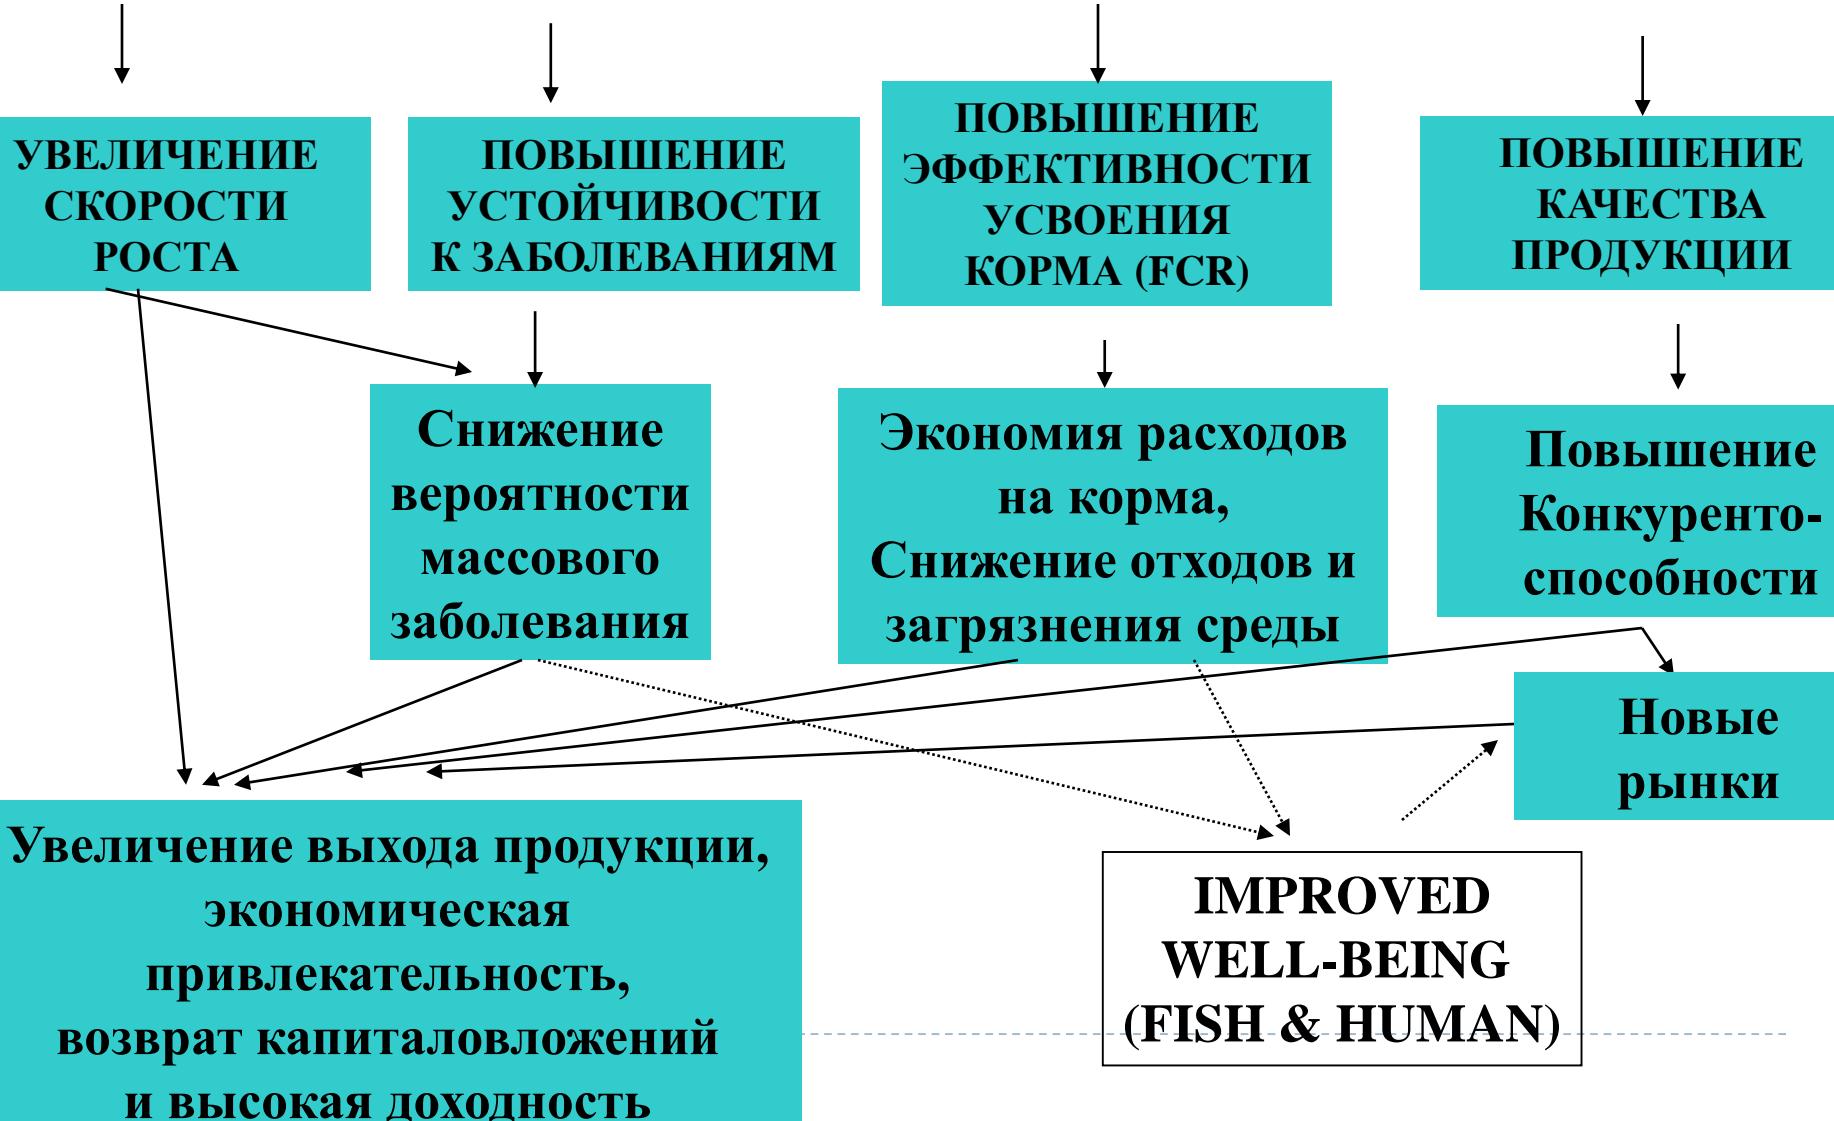

Схема изменения продуктивности пород при различных методах селекции (по Tave, 1986)

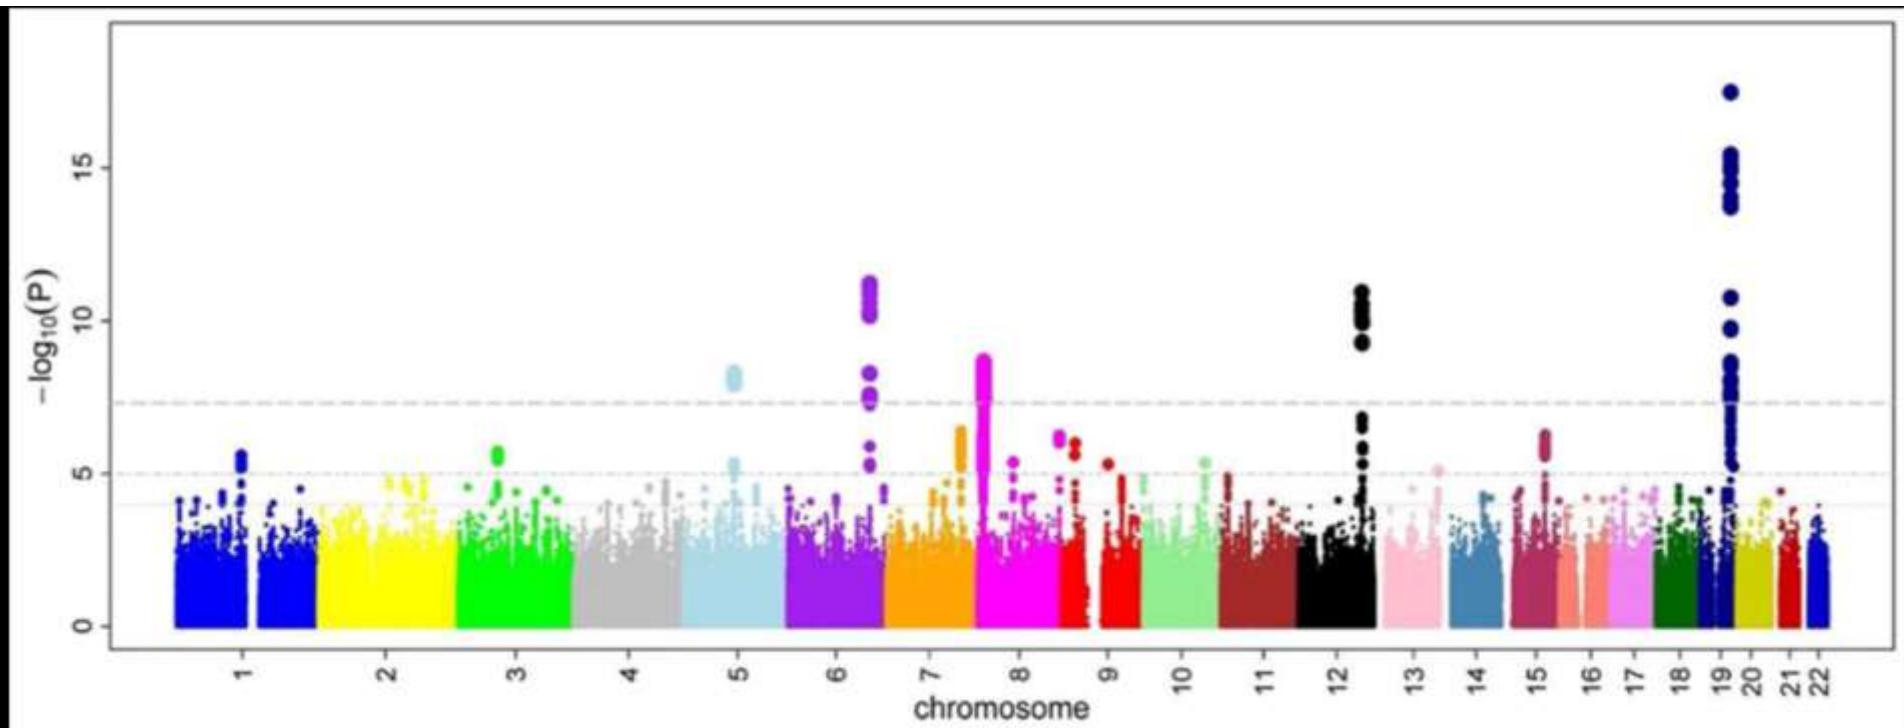

- ▶ Существует много различных подходов улучшения пород с использование генетики.
- ▶ Улучшение пород за счет селекции основано на использовании полигенной природной генетической изменчивости (эффект совокупности аллелей).
- ▶ Гибридизация основана на доминировании признаков и гетерозисе (эффект пар аллелей).
- ▶ Генетические манипуляции обычно являются «разовыми» (т.е. создание однополых или триплоидных рыб). Однако продолжительное применение генетических методов бывает необходимо для раскрытия полного потенциала вида как объекта аквакультуры.

Четыре основных критерия при селекции в аквакультуре

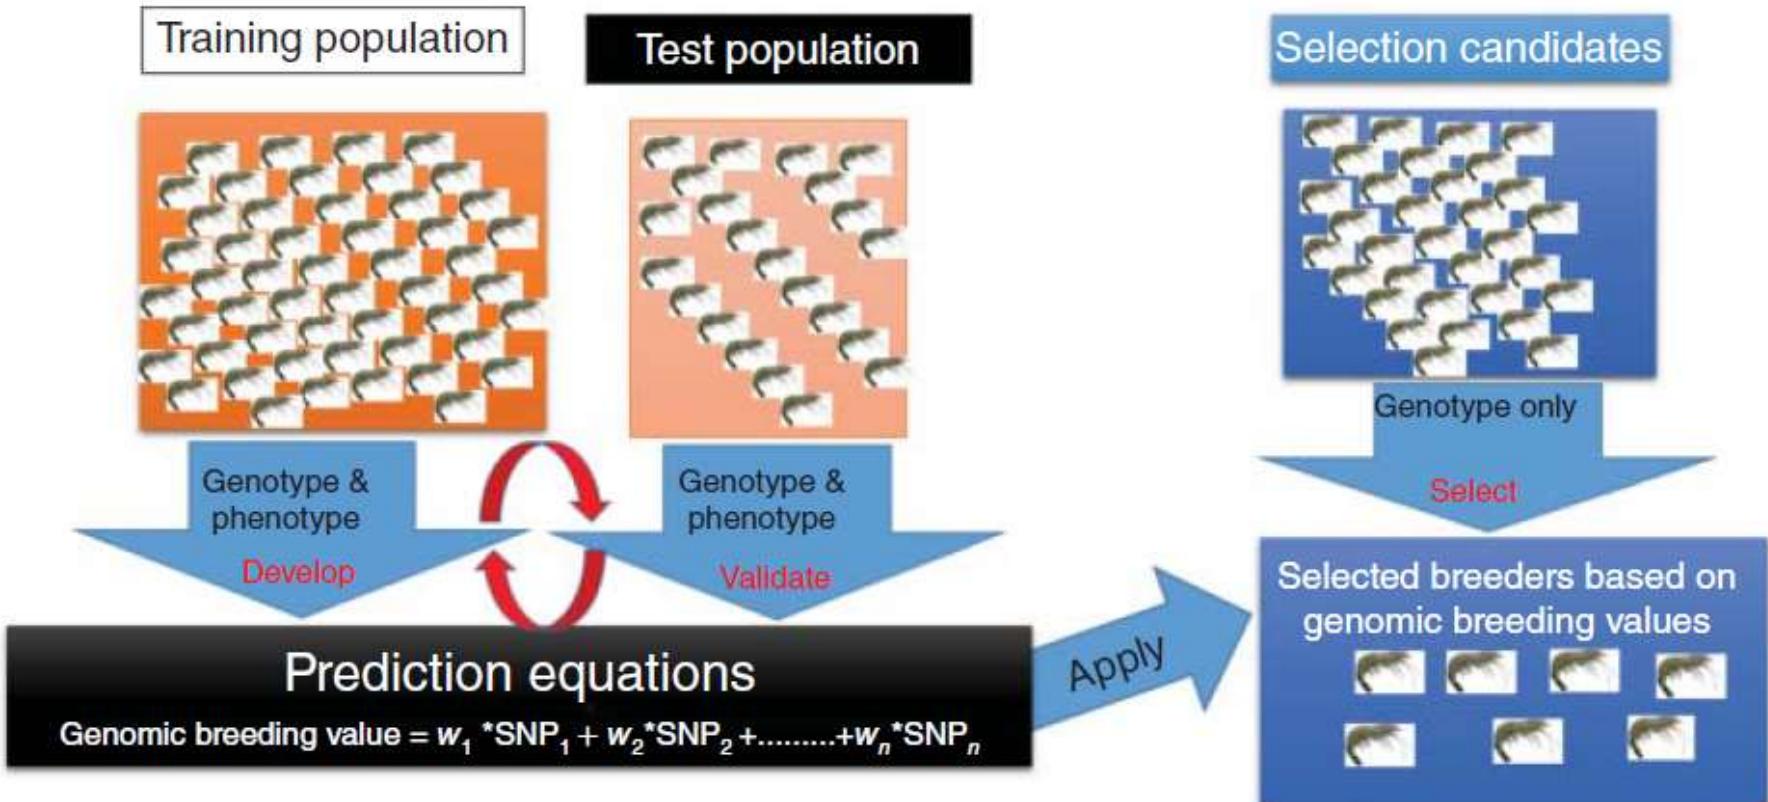

GWAS

Полногеномный поиск ассоциаций (англ. **GWAS**, Genome-Wide Association Studies) — направление биологических исследований, связанных с исследованием ассоциаций между геномными вариантами и фенотипическими признаками.

Принцип применения геномной селекции (MAS – marker-assisted selection)

AquAdvantage salmon

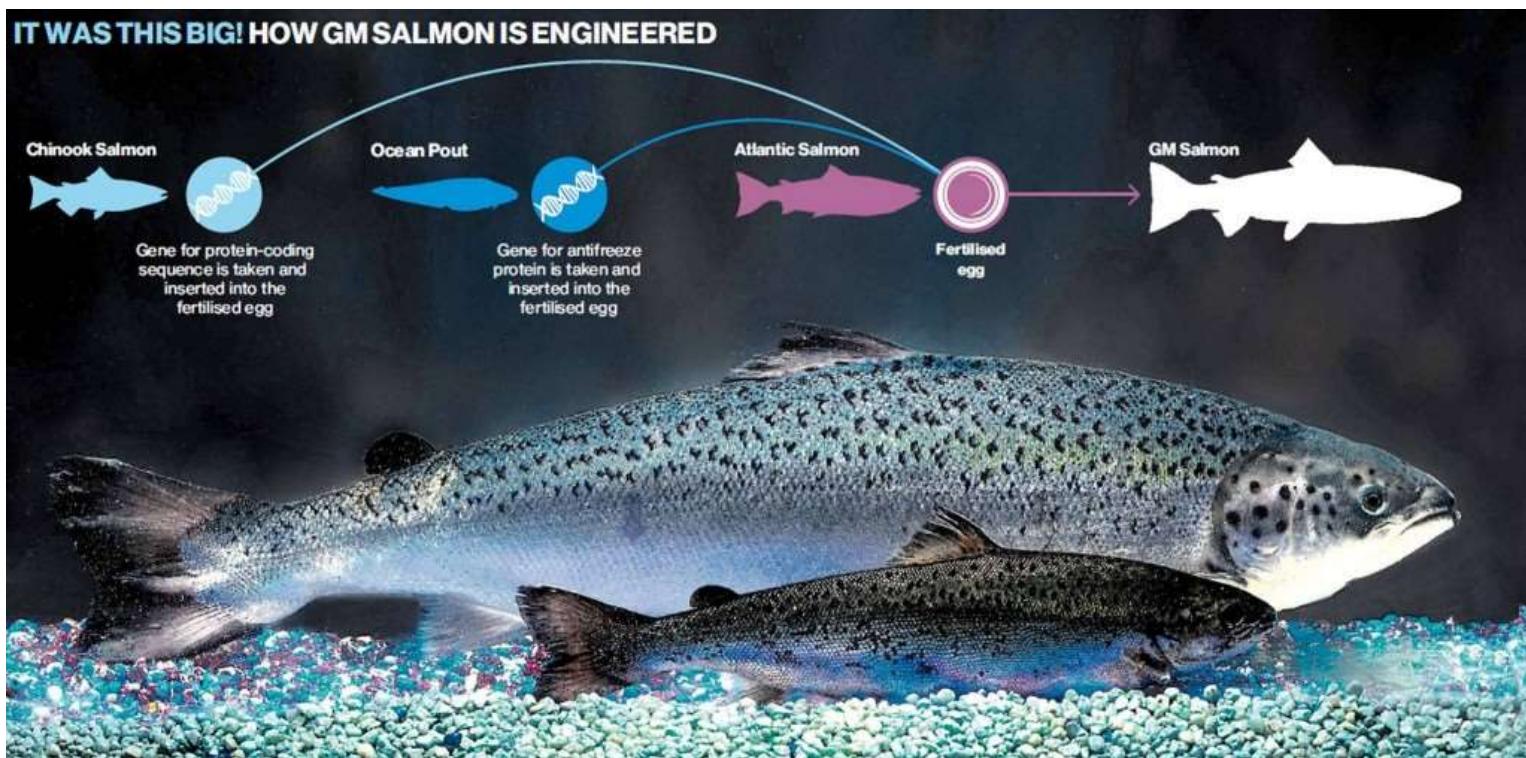

- ▶ Ген гормона роста кижуча с промотором от бельдюги (1 ген из 40,000, остальные – гены лосося)
- ▶ Растет круглогодично, товарного размера достигает за 18 мес. (обычный – за 3 года)
- ▶ Разрешен к выращиванию и продаже пока только в Канаде и только в УЗВ

- ▶ 100% самки, триплоид
- ▶ Чтобы вывести GM сорт на рынок – нужно в среднем 13 лет и 130 млн.\$

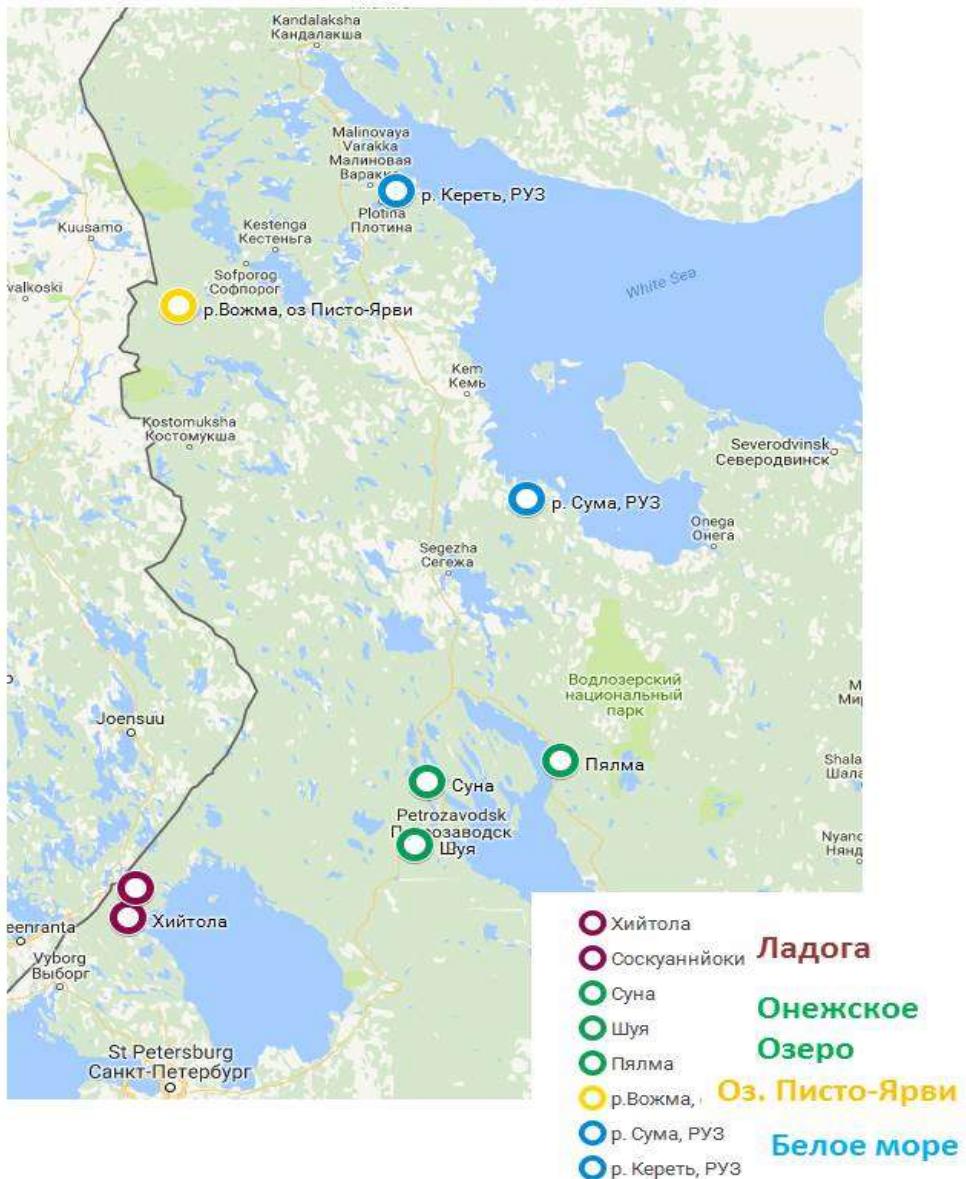

AquAdvantage salmon

AquAdvantage salmon is a genetically modified (GM) Atlantic salmon developed by AquaBounty Technologies. A growth hormone-regulating gene from a Pacific Chinook salmon, with a promoter from an ocean pout, was added to the Atlantic salmon's 40,000 genes. This gene enables it to grow year-round instead of only during spring and summer. The purpose of the modifications is to increase the speed at which the fish grows without affecting its ultimate size or other qualities. The fish grows to market size in 16 to 18 months rather than three years. The latter figure refers to varieties whose growth rate has already been improved by 2:1 as a result of traditional selective breeding.

Xanthine dehydrogenase

ssa01:5581773 T->C

Function [\[edit\]](#)

Xanthine dehydrogenase belongs to the group of molybdenum-containing hydroxylases involved in the oxidative metabolism of purines. The enzyme is a homodimer. Xanthine dehydrogenase can be converted to xanthine oxidase by reversible sulphydryl oxidation or by irreversible proteolytic modification.^[5]

Xanthine dehydrogenase catalyzes the following chemical reaction:

The three substrates of this enzyme are xanthine, NAD^+ , and H_2O , whereas its three products are urate , NADH , and H^+ . This enzyme participates in purine metabolism.

Comparative Biochemistry and Physiology Part B:

Comparative Biochemistry

Gene Set Enrichment Analysis

Представленность набора генов по функциональным категориям, метаболическим и регуляторным каскадам

Molecular Signatures Database v6.0

Overview

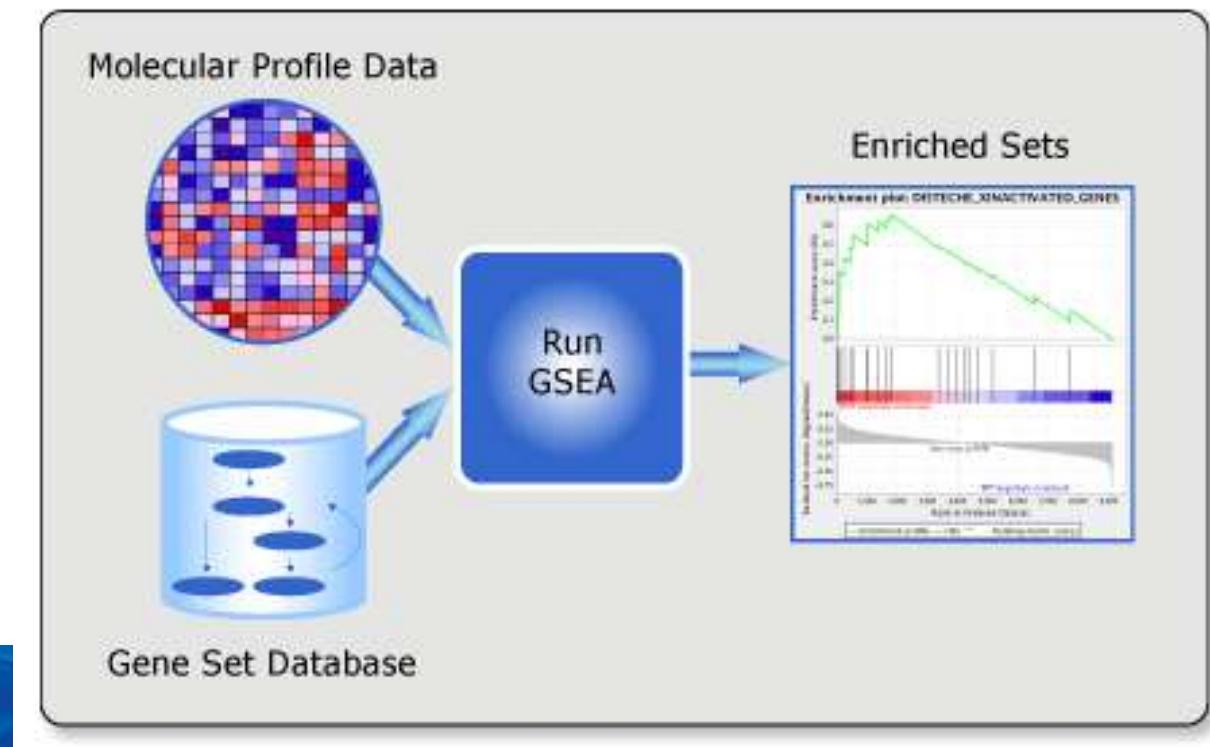

The Molecular Signatures Database (MSigDB) is a collection of annotated gene sets for use with GSEA software. From this web site, you can

- ▶ [Search](#) for gene sets by keyword.
- ▶ [Browse](#) gene sets by name or collection.
- ▶ [Examine](#) a gene set and its annotations. See, for example, the [GO_NOTCH_SIGNALING_PATHWAY](#) gene set page.
- ▶ [Download](#) gene sets.
- ▶ [Investigate](#) gene sets:
 - ▶ [Compute overlaps](#) between your gene set and gene sets in MSigDB.

Collections

The MSigDB gene sets are divided into 8 major collections:

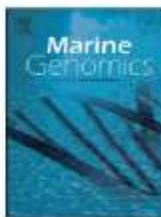

[hallmark gene sets](#) are coherently expressed

Research paper

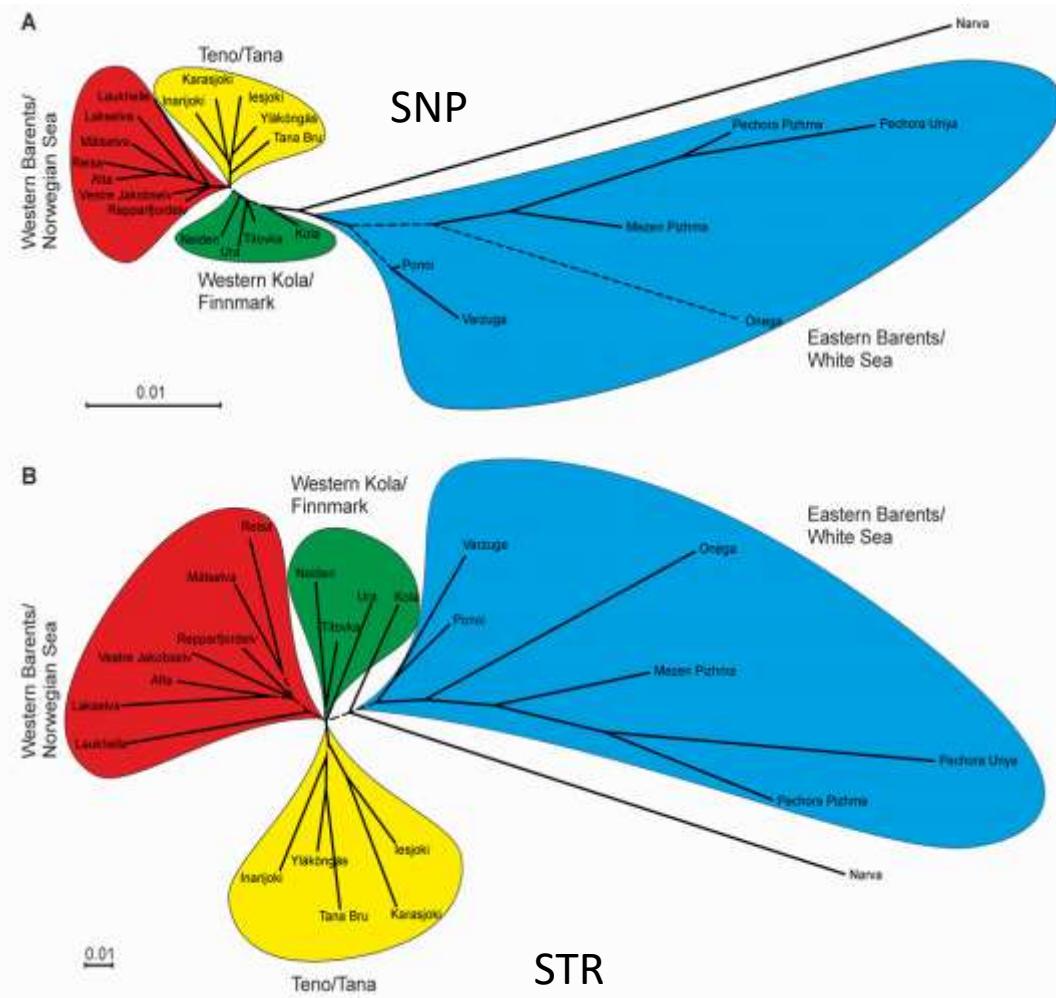

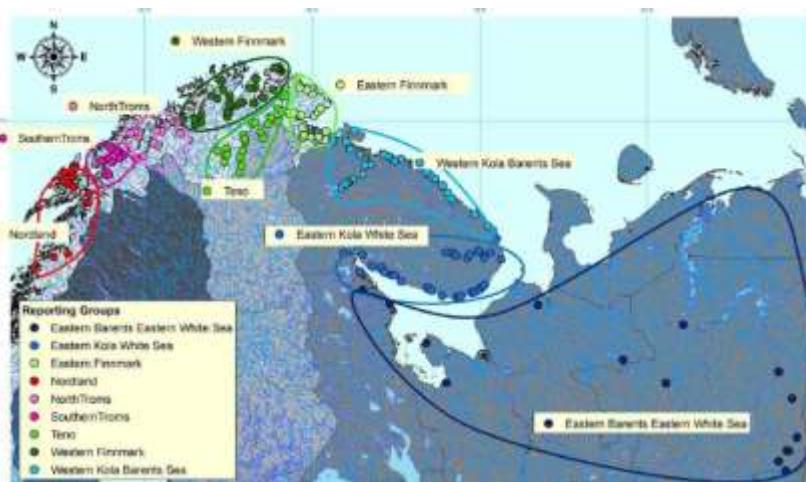

Genomic signatures of parasite-driven natural selection in north European Atlantic salmon (*Salmo salar*)

Ksenia J. Zueva^a, Jaakko Lumme^b, Alexey E. Veselov^c, Matthew P. Kent^d, Craig R. Primmer^{a,e,f,*}

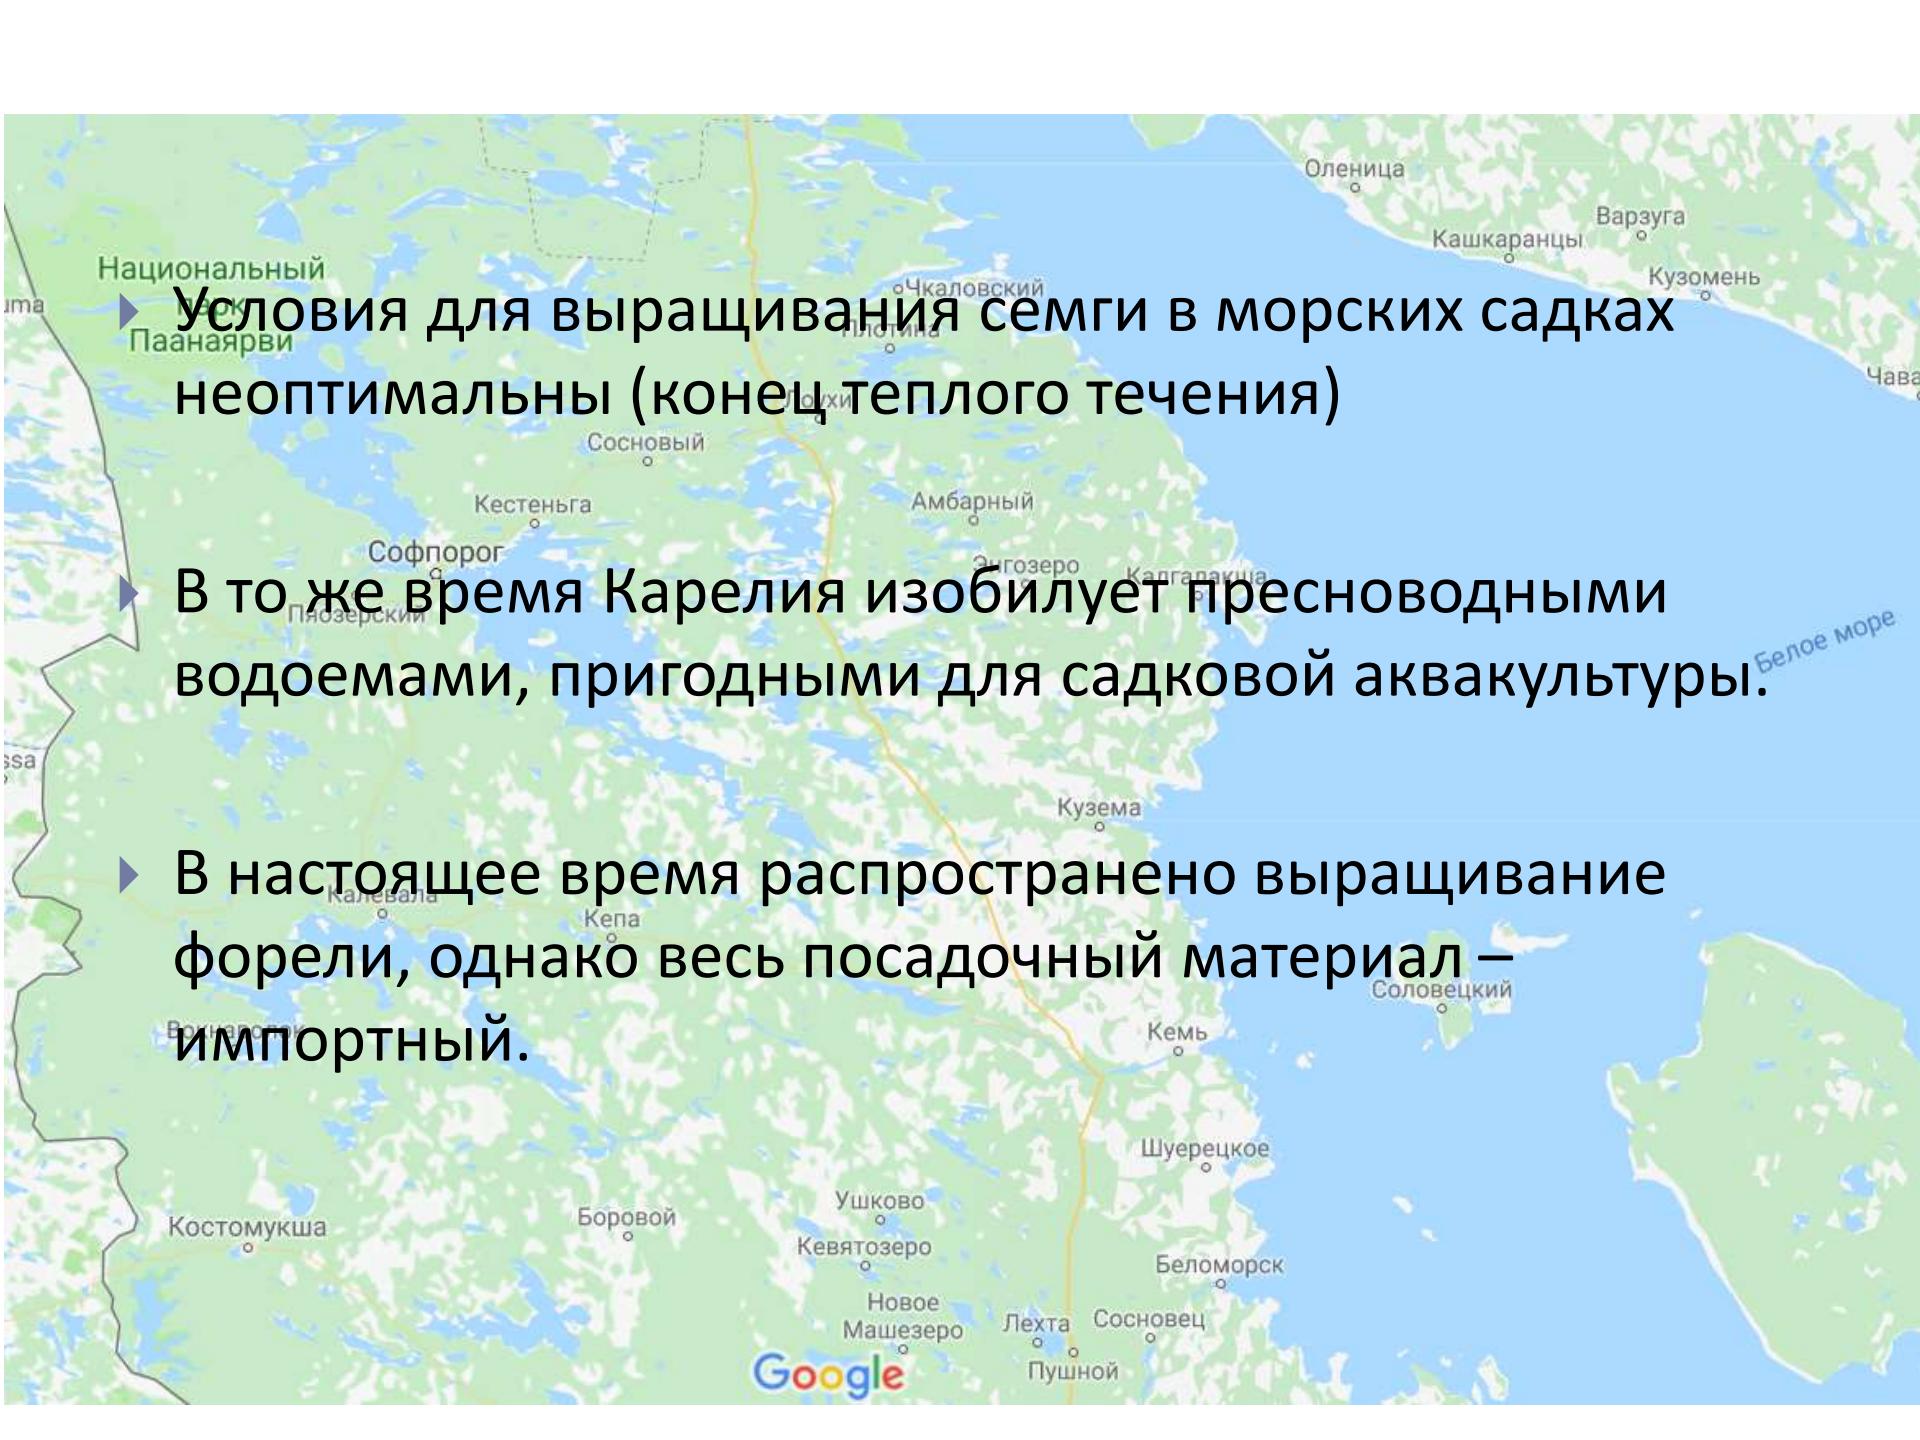

Генетическая дифференциация семги

Дополнительное секвенирование балтийского лосося - Невский ЛРЗ

- 
- ▶ Условия для выращивания семги в морских садках неоптимальны (конец теплого течения)
- ▶ В то же время Карелия изобилует пресноводными водоемами, пригодными для садковой аквакультуры.
- ▶ В настоящее время распространено выращивание форели, однако весь посадочный материал – импортный.

«Карельский супер-лосось»

- Адаптации к пресной воде и климатическим условиям Карелии, устойчивость к некоторым заболеваниям – от озерного лосося
- Быстрый рост, высокая конверсия корма, стрессоустойчивость – от современных коммерческих линий семги
- Использование *genome-assisted selection* в сочетании с современными методами семейной селекции

Благодарю за внимание!
